

EXPERIMENT 4

AIM: Working with Docker Network

Steps to Complete:

Step 1 - Create Network

The first step is to create a network using the CLI. This network will allow us to attach multiple containers which will be able to discover each other.

In this example, we're going to start by creating a *backend-network*. All containers attached to our backend will be on this network.

Task: Create Network

To start with we create the network with our predefined name.

```
docker network create backend-network
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network create backend-network
903d18d9d70460b5dfdba5ff7c6ce1415b1ecfabf3aaacfc88136f08c4c0ab5
```

Task: Connect To Network

When we launch new containers, we can use the *--net* attribute to assign which network they should be connected to.

```
docker run -d --name=redis --net=backend-network redis
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network disconnect frontend-network 0ab1077c0c0d
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker run -d --name=redis --net=backend-network redis
4839f38713e5e5eeab2d72e138900ff290327e1066f6d27c08170e997602af34
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> |
```

In the next step we'll explore the state of the network.

Step 2 - Network Communication

Unlike using links, *docker network* behave like traditional networks where nodes can be attached/detached.

Task: Explore

The first thing you'll notice is that Docker no longer assigns environment variables or updates the hosts file of containers. Explore using the following two commands and you'll notice it no longer mentions other containers.

```
docker run --net=backend-network alpine ping -c1 redis
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker run --net=backend-network alpine ping -c1 redis
Unable to find image 'alpine:latest' locally
latest: Pulling from library/alpine
96526aa774ef: Pull complete
Digest: sha256:eece025e432126ce23f223450a0326fbebde39cdf496a85d8c016293fc851978
Status: Downloaded newer image for alpine:latest
ping: bad address 'redis'
```

Step 3 - Connect Two Containers

Docker supports multiple networks and containers being attached to more than one network at a time.

For example, let's create a separate network with a Node.js application that communicates with our existing Redis instance.

Task

The first task is to create a new network in the same way.

```
docker network create frontend-network
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network create frontend-network
2fb2b0cf697215cfb91958d3a7eaf8ff706b42ab9ce2abffc53db3374d9668d7
PS C:\Users\hp\Desktop\ACO-LAB-2021-25>
```

When using the *connect* command it is possible to attach existing containers to the network.

```
docker network connect frontend-network redis
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network connect frontend-network 6ab1577c8e5a
PS C:\Users\hp\Desktop\ACO-LAB-2021-25>
```

When we launch the web server, given it's attached to the same network it will be able to communicate with our Redis instance.

```
docker run -d -p 3000:3000 --net=frontend-network katacoda/redis-node-docker-example
```

You can test it using `curl docker:3000`

```
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25> docker run -d -p 3000:3000 --net=frontend-network katacoda/redis-node-docker-example
Unable to find image 'katacoda/redis-node-docker-example:latest' locally
latest: Pulling from katacoda/redis-node-docker-example
[DEPRECATION NOTICE] Docker Image Format v1, and Docker Image manifest version 2, schema 1 support will be removed in an upcoming release. Suggest the author of docker.io/katacoda/redis-node-docker-example:latest to upgrade the image to the OCI Format, or Docker Image manifest v2, schema 2. More information at https://docs.docker.com/guide/deprecated-image-specs/

```

Step 4 - Create Aliases

Links are still supported when using *docker network* and provide a way to define an Alias to the container name. This will give the container an extra DNS entry name and way to be discovered. When using `--link` the embedded DNS will guarantee that localised lookup result only on that container where the `--link` is used.

The other approach is to provide an alias when connecting a container to a network.

Connect Container with Alias

The following command will connect our Redis instance to the frontend-network with the alias of *db*.

```
docker network create frontend-network2
```

```
docker network connect --alias db frontend-network2 redis
```

```
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25> docker network create frontend-network2
5a92725b3eb6ee28bcf7426c1defda5f75704dd5dd2c3a4216f09932f8e6dbdb
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25> docker network connect --alias db frontend-network2 redis
Error response from daemon: No such container: redis
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25> docker network connect --alias db frontend-network2 6ab1577c8e5a
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25>
```

When containers attempt to access a service via the name *db*, they will be given the IP address of our Redis container.

```
docker run --net=frontend-network2 alpine ping -c1 db
```

```
PS C:\Users\h\p\Desktop\ACO-LAB-2021-25> docker run --net=frontend-network2 alpine ping -c1 db
PING db (172.20.0.2): 56 data bytes
64 bytes from 172.20.0.2: seq=0 ttl=64 time=2.319 ms

--- db ping statistics ---
1 packets transmitted, 1 packets received, 0% packet loss
```

Step 5 - Disconnect Containers

With our networks created, we can use the CLI to explore the details.

The following command will list all the networks on our host.

```
docker network ls
```

We can then explore the network to see which containers are attached and their IP addresses.

```
docker network inspect frontend-network
```

```
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network inspect frontend-network
[
  {
    "Name": "frontend-network",
    "Id": "2fb2b0cf697215cfb91958d3a7eaf8ff706b42ab9ce2abffc53db3374d9668d7",
    "Created": "2023-10-20T18:01:45.597492086Z",
    "Scope": "local",
    "Driver": "bridge",
    "EnableIPv6": false,
    "IPAM": {
      "Driver": "default",
      "Options": {},
      "Config": [
        {
          "Subnet": "172.19.0.0/16",
          "Gateway": "172.19.0.1"
        }
      ]
    },
    "Internal": false,
    "Attachable": false,
    "Ingress": false,
    "ConfigFrom": {
      "Network": ""
    },
    "ConfigOnly": false,
    "Containers": {
      "6ab1577c8e5acd10972f048fb05daa663b18d67c62963d08405905e4de1f40e1": {
        "Name": "charming_johnson",
        "EndpointID": "4faec3220b033561da6a2b7fdd010bb2a9a6fa84583f6b34f0c879de1cbe689d",
        "MacAddress": "02:42:ac:13:00:02",
        "IPv4Address": "172.19.0.2/16",
        "IPv6Address": ""
      }
    },
    "Options": {},
    "Labels": {}
  }
]
```

The following command disconnects the redis container from the *frontend-network*.

```
docker network disconnect frontend-network redis
```

```
]
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> docker network disconnect frontend-network 6ab1577c8e5a
PS C:\Users\hp\Desktop\ACO-LAB-2021-25> |
```
